Networking is an important factor for any organization for 1) successful implementation of policies/decisions, 2) to suggest important recommendations and 3) to run the programmes of the organization.

It was recommended in the country paper that there should be funding and facilities for networking so as to bring the positive change and help in reducing the gender biasing in the field [1]. Here in India the focus of the policies of the Government is for the betterment of women in science in general and thus this provides a vast scope for working for women physicists in particular, that too from the grass root level [2],[3].

Nagpur is located at the geographical centre of the country. There are many research institutes, laboratories in and around Nagpur. In addition to these research institutes there are science and technical institutes as well, where quite a large number of women physicists are working.

These women physicists were networked and a local level body of women physicists was formed. Now next we propose to undertake women sensitization programme over various recommendations/outcome of the fourth International Conference of Women in Physics [4].
